

domain assembly

The assembly that implements the *domain* of your application, i.e. contains your subclasses of `DomainObject` (or, `BindableDomainObject`). Such subclasses are called [domain object classes](#) or [domain classes](#). The domain assembly can be inspected by [dbschema.exe](#) to derive a database schema for persisting instances of your domain classes. The domain assembly can be inspected by [uigen.exe](#) to discover your [domain model](#)) and derive a functional web application from it.
